

# The Queensland Node of Proteomics Australia

The Queensland Node of Proteomics Australia offers high throughput quantitative proteomics services to all life science researchers. Services are offered through a consortium of Australian universities and research institutes with world class facilities.

## Services offered

### Sample Preparation

Automated Sample preparation

### Protein Identification

By Data Dependant Analysis

### Protein quantification

By Data Dependent Analysis

By Data Independent Analysis

By Isobaric Tag Analysis

### Protein modification Analysis

By phosphorylation,  $\Gamma$  carboxylation

### Data analysis

Data processing workflows

## Contact

## Label-free quantification of a HeLa sample

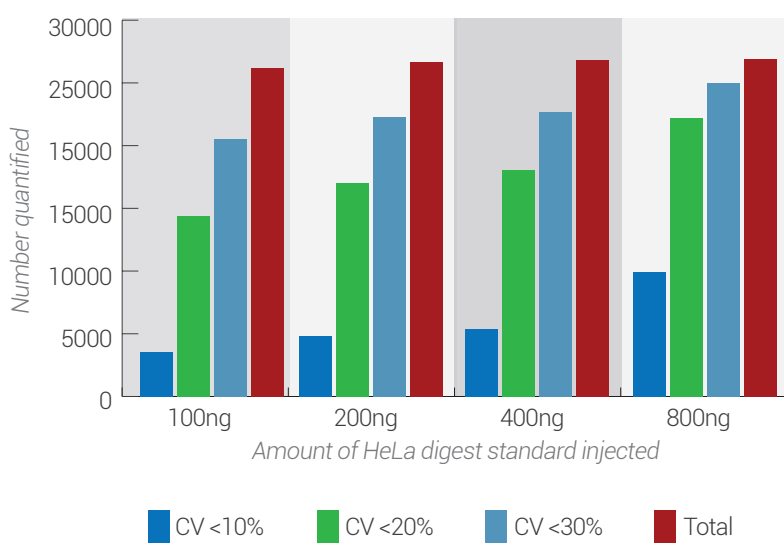

The Queensland node of Proteomics Australia specialises in high throughput quantitative proteomics, particularly label-free proteomics for systems biology and biotechnology applications. Label-free quantification is the quantification of MS peptide signals by LC/MS/MS data without an isotopic label. For example, we can quantify up to 8700 proteins in 200ng of a HeLa digest, from which more than 3400 have a median CV of less than 10% using 200 ng of HeLa digest (equivalent to ~1000 cells).

### Coefficient of variation of protein quantification

### Coefficient of variation of peptide group quantification

Our node is part of a national consortium initiative, comprising the Adelaide Proteomics Centre (University of Adelaide), The Monoclonal Antibody Technology Facility (Monash University), Monash Biomedical Proteomics Facility (Monash University), the Australian Proteome Analysis Facility (Macquarie University) and Proteomics International.
